

ABSTRACT OF THE DISCLOSURE

A safety for a displacement device mounted on a motor vehicle. A door control device (TSG) and a central control device (ZSG) of a motor vehicle including a power switch (LS) which gets an electromechanical unit (Sch) under a blocked (safe) state. The central control device is connected to the door control device and other door control devices of the vehicle by means of links (CAN) such that at least one electromechanical unit is controllable by the central device with the aid of the link. The door control device is connected to the central control device by a hardwired electric link (St) which is independent from the links. The potential of a control connection of the power switch or the power connection of the door control device can be controlled by the central control device by means of the independent hardwire electric link.
